1. DECLARATION OF GENERAL INFORMATION

Introduction

The European Plastics Pipes and Fittings Association (TEPPFA) deems it important to have an insight into the integral environmental impacts that are encountered during the lifespan of particular pipe system applications.

With this framework in mind, in 2010 TEPPFA has set up an LCA/EPD project with the Flemish Institute for Technological Research (VITO) which resulted in an EPD. The present EPD is the update of the EPD issued in 2012 – foreground data remained the same, with only the datasets being updated to the latest available version (Ecoinvent 3.3 replaced Ecoinvent 2 datasets).

It outlines the various environmental aspects, which accompany the polyvinylchloride (PVC-U) multilayer sewer pipe system with a core of foam and recyclates, from the primary extraction of raw materials up to and including the end of life (EoL) treatment after its reference service lifetime.

Name and address of manufacturers

TEPPFA, Avenue de Cortenbergh, 71, B-1000 Brussels, Belgium
Tel: +32 2 736 24 06
E-Mail: info@teppfa.eu
Website: www.teppfa.eu

PVC-U pipe system’s use and functional unit

The EPD refers to a typical European public sewer pipe system built of PVC-U multilayer sewer pipes with a core of foam and recyclates, from the cradle to the grave, including raw material extraction, transportation to converters, converting process, transport to trench, construction, use and end of life. Environmental indicators are expressed for the complete life cycle, from the cradle to the grave, so for an average European PVC-U multilayer sewer pipe system with a core of foam and recyclates.

The functional unit is defined as “The below ground gravity transportation of sewage over a distance of 100 m by a typical public European PVC-U multilayer pipe system with a core of foam and recyclates (Ø 250mm) from the entrance of a public sewer system to the entrance of the waste water treatment plant, over its complete service life cycle of 100 years, calculated per year”.

Product name & graphic display of product

PVC-U multilayer sewer pipe system with a core of foam and recyclates (civil applications).
Description of the different components of the PVC-U multilayer sewer pipe system with a core of foam and recyclates

The environmental burdens are calculated in relation to the functional unit, which resulted for the typical European PVC-U multilayer sewer pipe system with a core of foam and recyclates in the following basic pipe system components: PVC-U multilayer pipes (with a foamed core of unplasticized PVC and recyclates), PVC-U fittings, PP manholes and SBR sealing rings.

The system consists of PVC-U multilayer pipes (with a core of foamed PVC-U and recyclates) red brown, SN 4, diameter 250 mm, 5 m length, socketed, and PVC-U fittings (representative for the typical pipe diameter from the entrance of a public sewer system to the entrance of the waste water treatment plant).

Manhole roughly every 45 metres (630 mm shaft – SMP report, 2005). The manhole covers are not included in the LCA study. Volume of fittings including seals (approximately 5% of the PVC solid wall sewer pipes) calculated based on actual sales data. The pipe system has a reference length of 100 metres; slope 1/200 and filling rate 100%. Service lifetime of 100 years.

The EPD is declared as the average environmental performance for a typical European PVC-U multilayer sewer pipe system with a core of foamed, unplasticized virgin PVC-U and recyclates, from the primary extraction of raw materials up to and including the end of life (EoL) treatment after its reference service lifetime of 100 years.

EPD programme and programme operator

The present EPD is in line with the ongoing standardization work by CEN TC 350 (EN15804 and EN15942). A programme operator related to the CEN TC 350 has not been established yet.

Date of declaration and validity

August, 2018
The EPD has a 5 year validity period (August, 2023)

Comparability

Please note that EPDs of construction products may not be comparable if they do not comply with the CEN TC 350 (EN15804 and EN15942) standards.

Typical European PVC-U multilayer sewer pipe system with a core of foam and recyclates EPD

The present EPD outlines various environmental aspects, which accompany a representative average European PVC-U multilayer sewer pipe system with a core of foamed, unplasticized virgin PVC-U and recyclates, from the primary extraction of raw materials up to and including the end of life (EoL) treatment after its reference service lifetime of 100 years.

Group of manufacturers

The EPD for the PVC-U multilayer sewer pipe system with a core of foam and recyclates is representative for an anticipated European typical PVC-U multilayer sewer pipe system. The TEPPFA member companies represent more than 50% of the European market for extruded plastic pipes. For an overview of all members and national associations within TEPPFA we refer to pages 12-14 of this EPD.

Content of the product system

The product system does not contain materials or substances that can adversely affect human health and the environment in all stages of the life cycle.

Retrieve information

Explanatory material may be obtained by contacting TEPPFA (http://www.teppfa.eu)
2. DECLARATION OF THE MATERIAL CONTENT

The European Polyvinylchloride (PVC-U) multilayer sewer pipe system with a core of foam and recyclates does not contain any substances as such or in concentration exceeding legal limits, which can adversely affect human health and the environment in any stages of its entire life cycle.

3. DECLARATION OF THE ENVIRONMENTAL PARAMETERS DERIVED FROM LCA

3.1 Life cycle flow diagram

The EPD refers to a typical European PVC-U multilayer sewer pipe system with a core of foam and recyclates, from the cradle to the grave, including product stage, transport to construction site and construction process stage, use stage and end of life stage.

- **Product stage**: raw material extraction and processing, recycling processes for recycled material input, transport to the manufacturer, manufacturing (including all energy provisions, waste management processes during the product stage up to waste for final disposal):
  - Production of raw materials for PVC-U multilayer pipes with a core of foam and recyclates
  - Transport of PVC-U multilayer pipe raw materials to converter
  - Converting process for PVC-U multilayer pipes with a core of foam and recyclates (extrusion), including packing of the pipes
  - Production of raw materials for PVC-U fittings
  - Transport of PVC-U fittings raw materials to converter
  - Converting process for PVC-U fittings (injection moulding), including packing of the fittings
  - Production of PP manholes (raw materials + converting process)
  - Production of SBR sealings (raw materials + converting process)

- **Construction process stage**: including all energy provisions, waste management processes during the construction stage up to waste for final disposal
  - Transport of PVC-U multilayer sewer pipe system with a core of foam and recyclates to the trench
  - Installation of PVC-U multilayer pipe system with a core of foam and recyclates in the trench

- **Use stage (maintenance and operational use)**: including transport and all energy provisions, waste management processes up to waste for final disposal during this use stage
  - Operational use is not relevant for the PVC-U multilayer sewer pipe system with a core of foam and recyclates
  - Maintenance of the PVC-U multilayer sewer pipe system with a core of foam and recyclates during 100 years of service lifetime in the trench

- **End of life stage**: including all energy provisions during the end of life stage
  - Disassembly of PVC-U multilayer sewer pipe system with a core of foam and recyclates after 100 years of reference service lifetime at the trench
  - Transport of PVC-U multilayer sewer pipe system with a core of foam and recyclates after 100 years of reference service lifetime at the trench to an end-of-life treatment
  - End-of-life treatment of PVC-U multilayer pipe system with a core of foam and recyclates after 100 years of reference service lifetime
**Production** of raw materials for all PVC-U multilayer sewer pipe system components

**Transport** of these raw materials to pipe system component producers

**Production** of all PVC-U multilayer sewer pipe system components

**Transport** of PVC-U multilayer sewer pipe system to the trench

**Installation** of PVC-U multilayer sewer pipe system at the trench

**Use** and maintenance of PVC-U multilayer sewer pipe system

**Disassembly** of PVC-U multilayer sewer pipe system after its reference service lifetime

**Transport** of PVC-U multilayer sewer pipe system after its reference service lifetime to an end-of-life treatment

**End-of-life** waste treatment of complete PVC-U multilayer sewer pipe system
3.2 Parameters describing environmental impacts

The following environmental parameters are expressed with the impact category parameters of the life cycle impact assessment (LCIA).

<table>

4.2 Use stage: operation and maintenance

**Operation:**
Operational use is not relevant for the EPD, since it falls outside the system boundaries of the LCA project. Moreover, the PVC-U multilayer sewer pipe system with a core of foam and recyclates is a gravity pipe system.

**Maintenance:**
Energy consumption for jetting: 5.4 kWh per FU Water consumption for jetting: 0.12 m³ per FU
Maintenance in case of the PVC-U multilayer sewer pipe systems is specifically related to jetting. Jetting happens 4 times in a 100 year service lifetime. One jetting operation needs an energy consumption of 4 litres of gasoline and 3 m³ of water per 100 metres of pipe system.

4.3 End of life

The following end of life scenarios have been taken into account:
- Estimated reference service lifetime of 100 years
- EoL approach for landfill, incineration with energy recovery (impacts and credits are assigned to the life cycle that generates the waste flows)
- Recycled content approach for recycling and use of recyclates (= impact of recycling and credits for recyclates, because less virgin materials are needed is assigned to the life cycle that uses the recyclates)

<table>
<thead>
<tr>
<th>Processes</th>
<th>Parameter unit expressed per functional unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collection process</td>
<td>After a reference service lifetime of 100 years the PVC-U multilayer sewer pipe system with a core of foam and recyclates might be replaced. In most cases (95%) the pipe system will be left in the ground. In some cases (5%) the pipe system is taken out and treated (landfilled or incinerated).</td>
</tr>
<tr>
<td>Recycling system</td>
<td></td>
</tr>
<tr>
<td>Final deposition</td>
<td></td>
</tr>
<tr>
<td><strong>EOL scenario PVC-U pipes</strong></td>
<td></td>
</tr>
<tr>
<td>Mechanical recycling</td>
<td>2,5%</td>
</tr>
<tr>
<td>Incineration</td>
<td>2,5%</td>
</tr>
<tr>
<td>Left in ground</td>
<td>95%</td>
</tr>
</tbody>
</table>

The transportation distance of the PVC-U pipe system from the trench to a waste treatment facility depends on the treatment option. For mechanical recycling we assumed an average transportation distance of 600 km and for incineration an average distance of 150 km. Environmental burdens associated with transportation are calculated by means of the following Ecoinvent V3.3 datarecord "Transport, freight, lorry 3.5-7.5 metric ton, EURO4 (RER)| transport, freight, lorry 3.5-7.5 metric ton, EURO4 | Alloc Rec, U"
5. ADDITIONAL INFORMATION ON EMISSIONS TO INDOOR AIR, SOIL AND WATER DURING USE STAGE

Emissions to indoor air:
Since the PVC-U multilayer sewer pipe system with a core of foam and recyclates is a buried system (in trench) we can confirm that emissions to indoor air are not relevant.

Emissions to soil and water:
Despite there is no approved European measurement method available, we can confirm that the PVC-U multilayer sewer pipe system with a core of foam and recyclates does not contain any substances mentioned on the REACH-list.
